there exist integers x,y. xa = 1 mod n _ a _ art. xa=yn+1 \Leftrightarrow $\chi a - y n = 1$ \Leftrightarrow gcd(a,n)=1a, n with g cd(a, n) = 1can we find the x, y giving na+yn=12 $\chi \equiv a^{-1} \mod \Lambda$. Extended Euclidean Agorthm. Starting at end of the E.A. 10 = 90 - 2.40=90-2.(310-3.90) 40=310-3.90 $q_0 = 7|0-2.310$ =7.90 -2.310 =7.(710-2.310)-2.310

=7.710-16.310
